Type hints usage in Python projects

Software Composition Seminar

Student: Jovana Mičić

Supervisor: Nevena Lazarević

15. May 2018.

Example

```
def fetch(artist: str, song: str, album: str) -> str:
    Helpers = hlp.HELPERS
    lyrics = None
    for helper in helpers:
        try:
            lyrics = helper.fetch(artist, song, album)
        except requests.ConnectionError as error:
            log.warning('Connection error: %s', error)
    if lyrics:
        break
    return lyrics
```

Who uses type hints?

- 21 Python libraries and projects analysed

scikits-image
image processing in python

PYTORCH

matplotlib

CherryPy

A Minimalist Python Web Framework

Who uses type hints?

	Name	Num of lines		Name	Num of lines
1	sckit-learn	215122	12	Tale	23698
2	matplotlib	213210	13	pendulum	22241
3	networkx	116963	14	GitPython	21075
4	pytorch	89896	15	urllib3	20726
5	scikit-image	81402	16	requests	9602
6	mypy	74699	17	httpie	6370
7	pytype	47473	18	pydantic	5529
8	scrapy	35816	19	MonkeyType	4423
9	neupy	34980	20	pyquery	2848
10	cherryypy	29506	21	httpbin	2317
11	paramiko	25031			

*How many of you
know for type hints
in Python?*

u^b

b
**UNIVERSITÄT
BERN**

Let's see the results...

Usage in projects and libraries

Number of projects using and not using type hints

Why are type hints not popular?

- Lot of people do not know about it
- Typing is not that popular among Python developers
- Not helpful documentation and tutorials
- mypy and PyCharm support is partial and buggy

Usage in projects and libraries

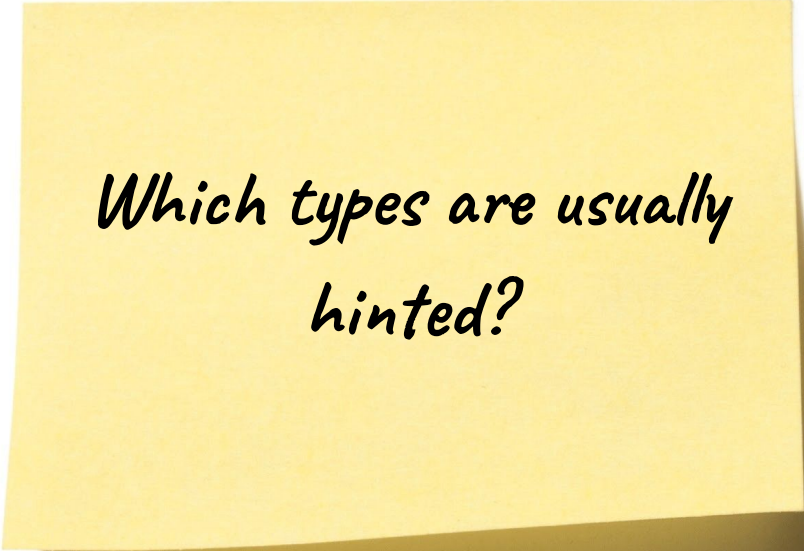

Usage of Type Hints in projects and libraries

Usage in projects and libraries

Creation year of projects and libraries using type hints

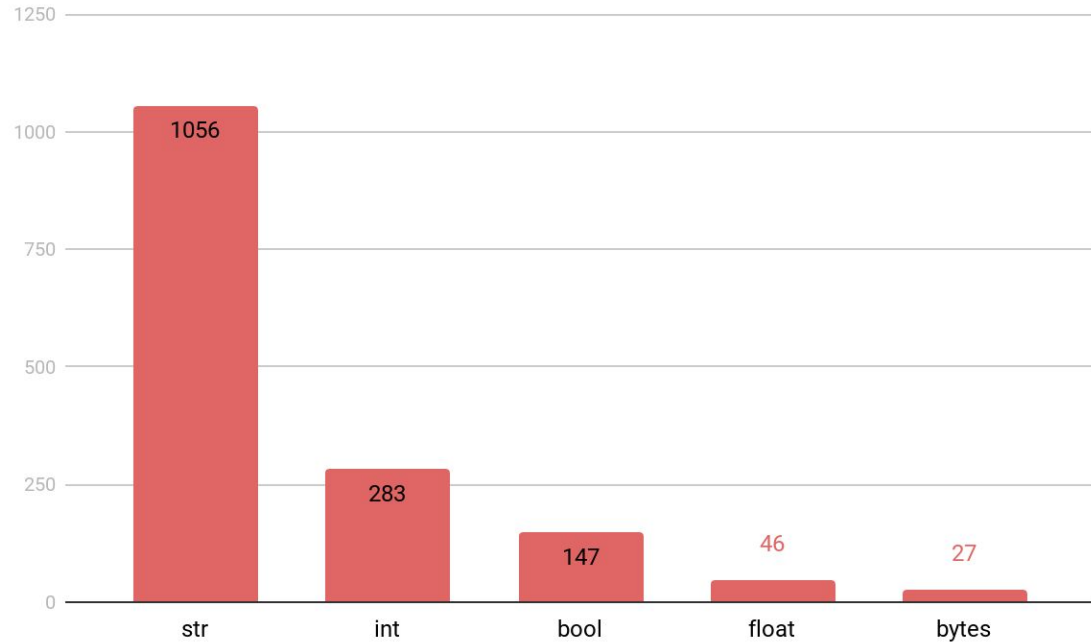

*Which types are usually
hinted?*

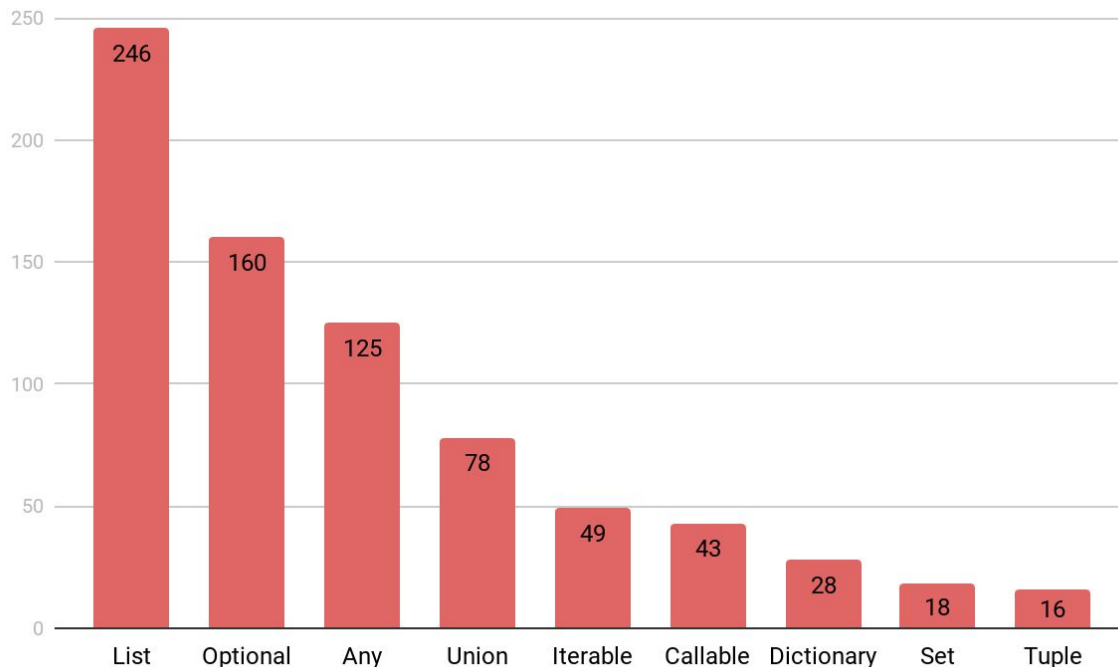

Most hinted types

Hinted built-in types

Hinted types from typing module

Conclusion

- Programmers **do not use** often type hints
- Type hints are usually used **in libraries** implementation
- Mostly hinted types are **project-related** types
- The most hinted built-in type is **string**

Conclusion

It is not always possible to predict an argument type by analysing its name...

```
def fetch(artist: str, song: str, album: str) -> str:
    Helpers = hlp.HELPERS
    lyrics = None
    for helper in helpers:
        try:
            lyrics = helper.fetch(artist, song, album)
        except requests.ConnectionError as error:
            log.warning('Connection error: %s', error)
    if lyrics:
        break
    return lyrics
```

Conclusion

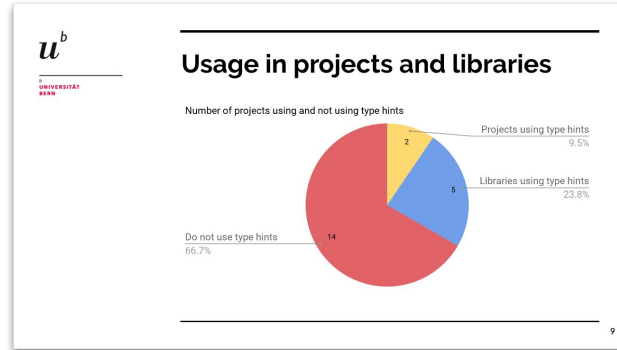

...but we can make assumptions:

- a name starting with a verb (e.g. **has_connected**) is very likely to be **boolean**
- a noun in plural form (e.g. **connections**) probably represents a **collection**

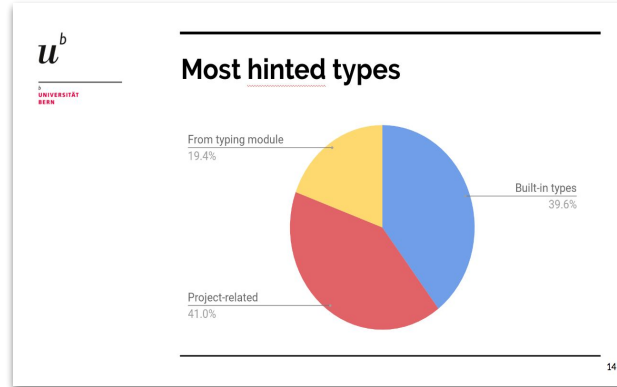

Future work

- Find more projects which use type hints
- Work more on argument type prediction
- Perhaps write a paper for conference

Summarize

- u^b
UNIVERSITÄT
BERN
- ## Why are type hints not popular?
- Lot of people do not know about it
 - Typing is not that popular among Python developers
 - Not helpful documentation and tutorials
