

# Executable graph models in Bloc

Louis Müller

Software Composition Seminar, fall 2019

# Broader vision

Many software models are based on graphs.

- ➡ Exploring possibilities in GT to interactively construct graphs.

# Project goals

Experiment with ways to quickly build graph models using Bloc:

- interactively construct graphs (syntax)
- assign interpretation to graphs (semantics)
- execute graph models

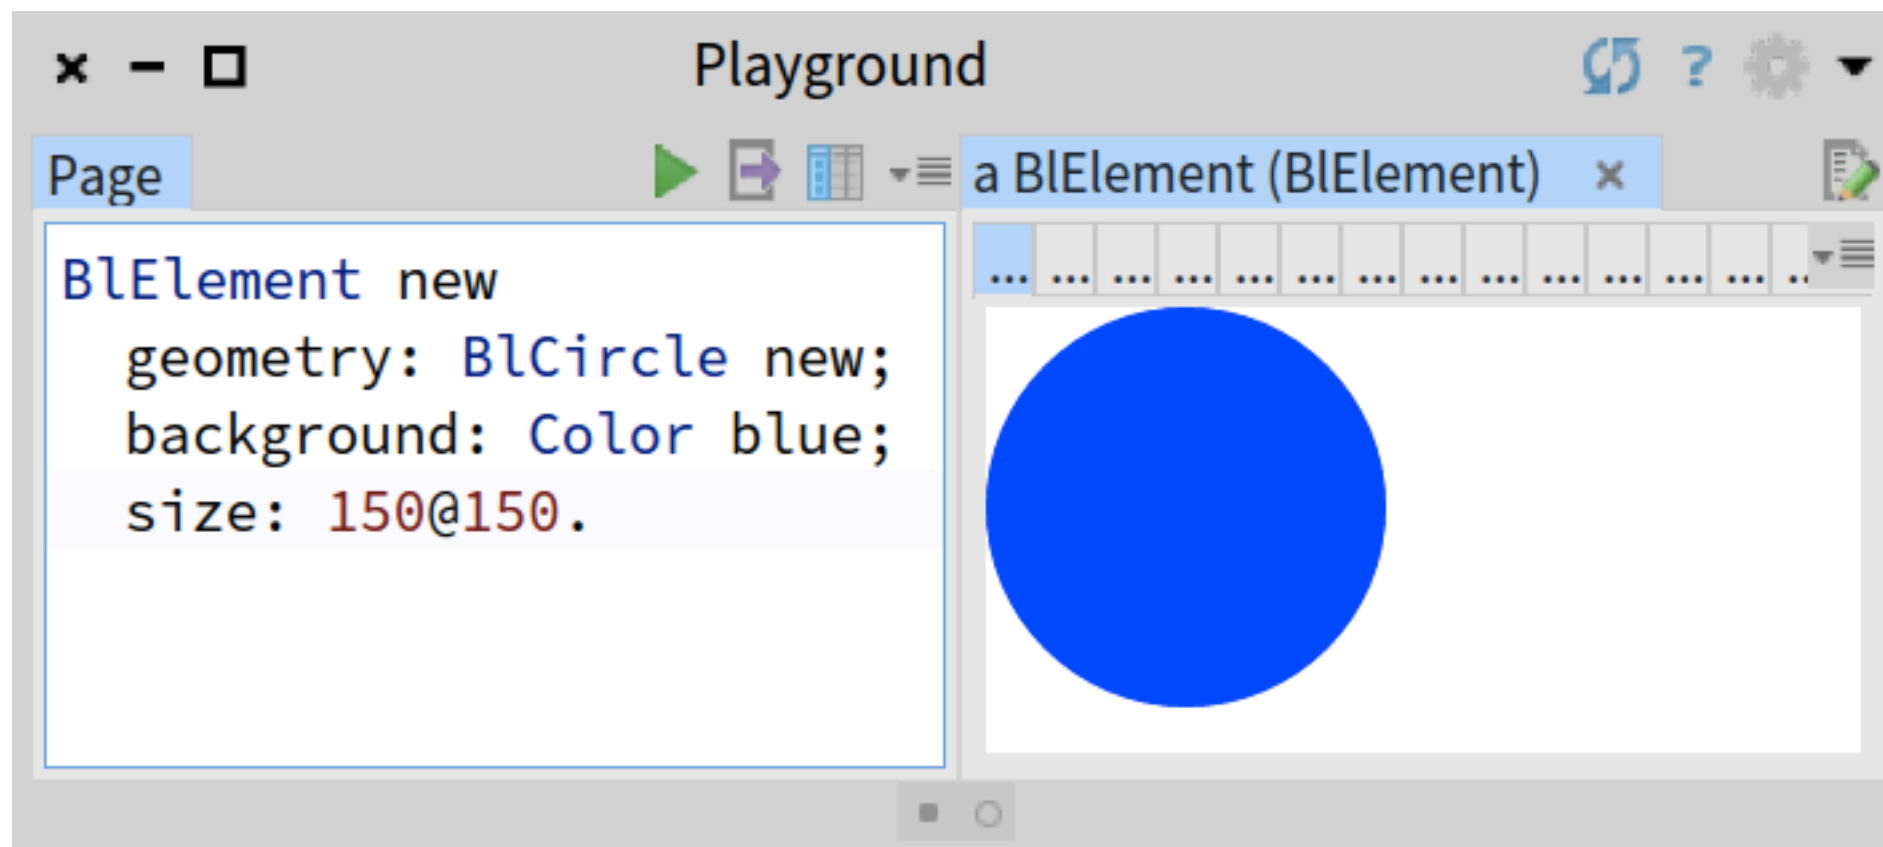

# What is Bloc?

**Glamorous Toolkit (GT)** is a moldable development environment written in Pharo Smalltalk.

**Bloc** is the graphical framework delivered with **GT**.

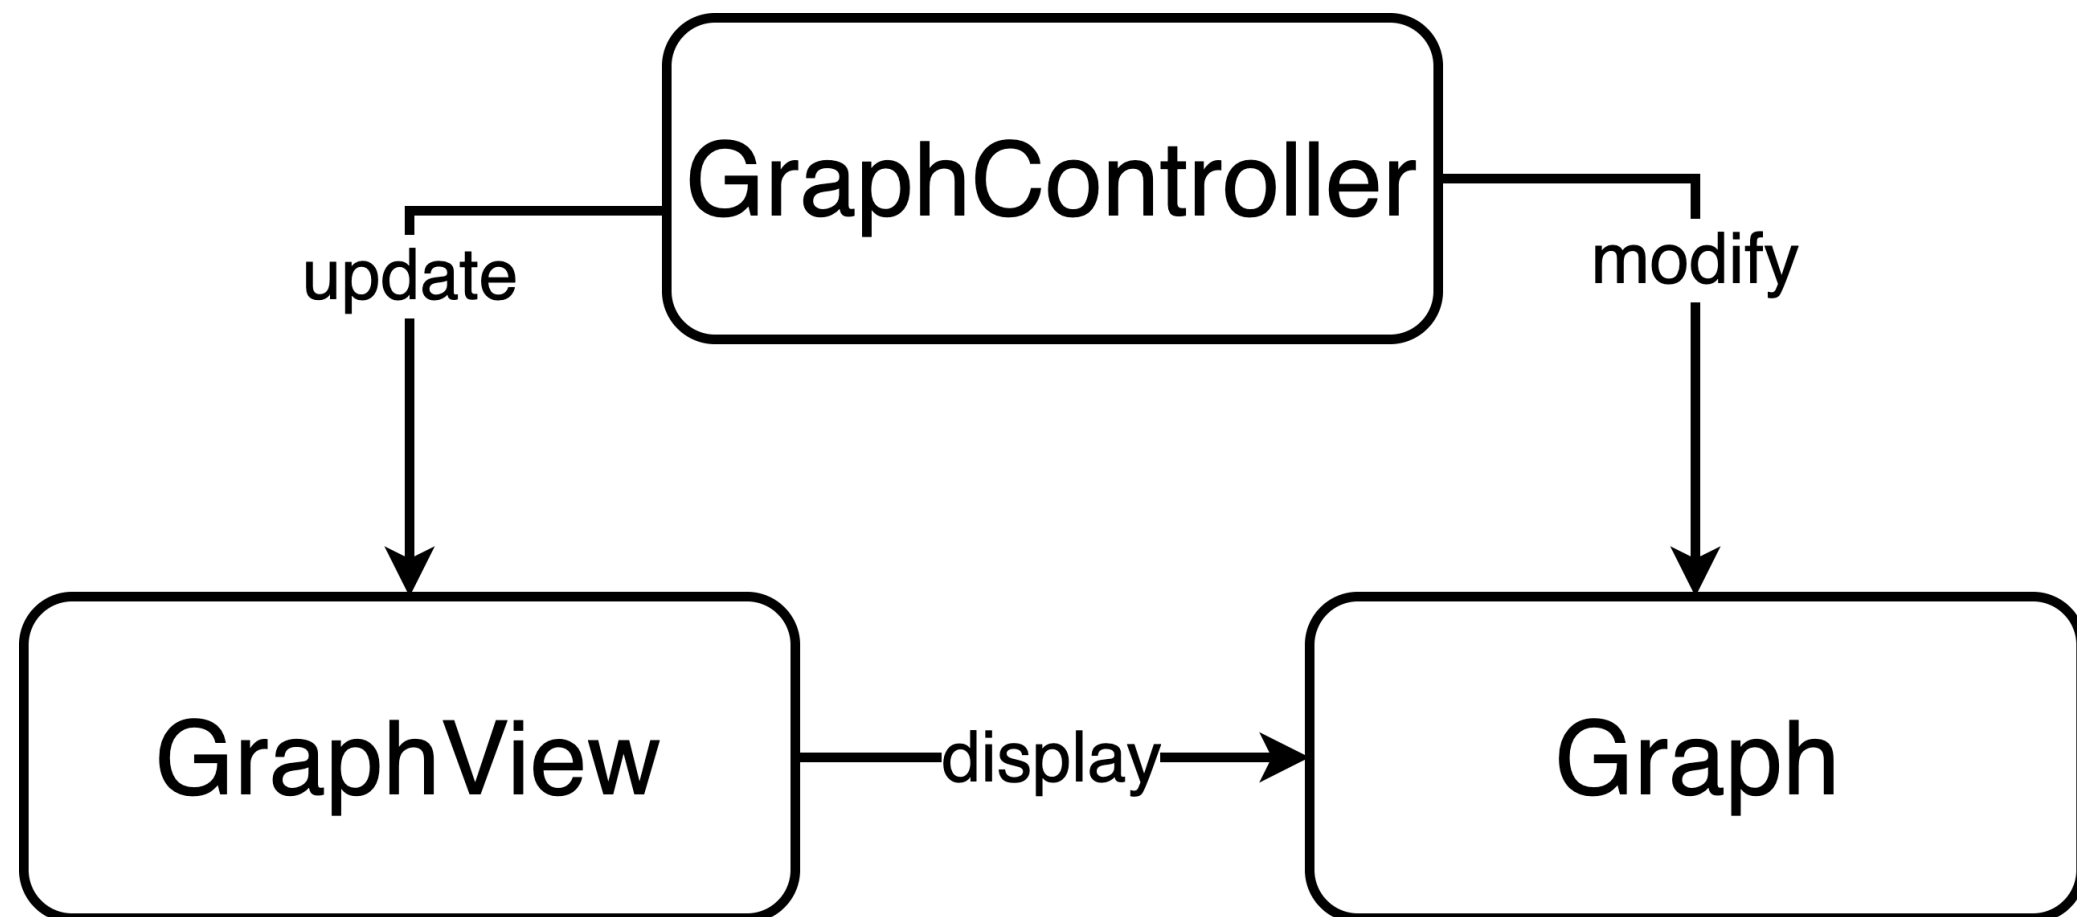

# Bloc hierarchy

BlElement is the root class of all visual elements in Bloc

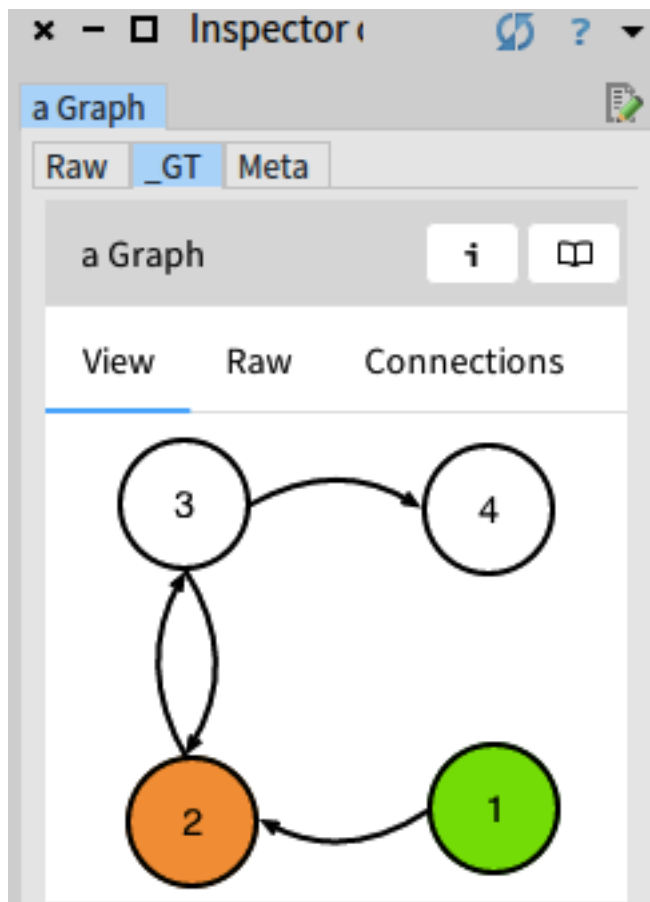

# Implementation background

Applied model-view-controller (MVC) design pattern

# Implementation results

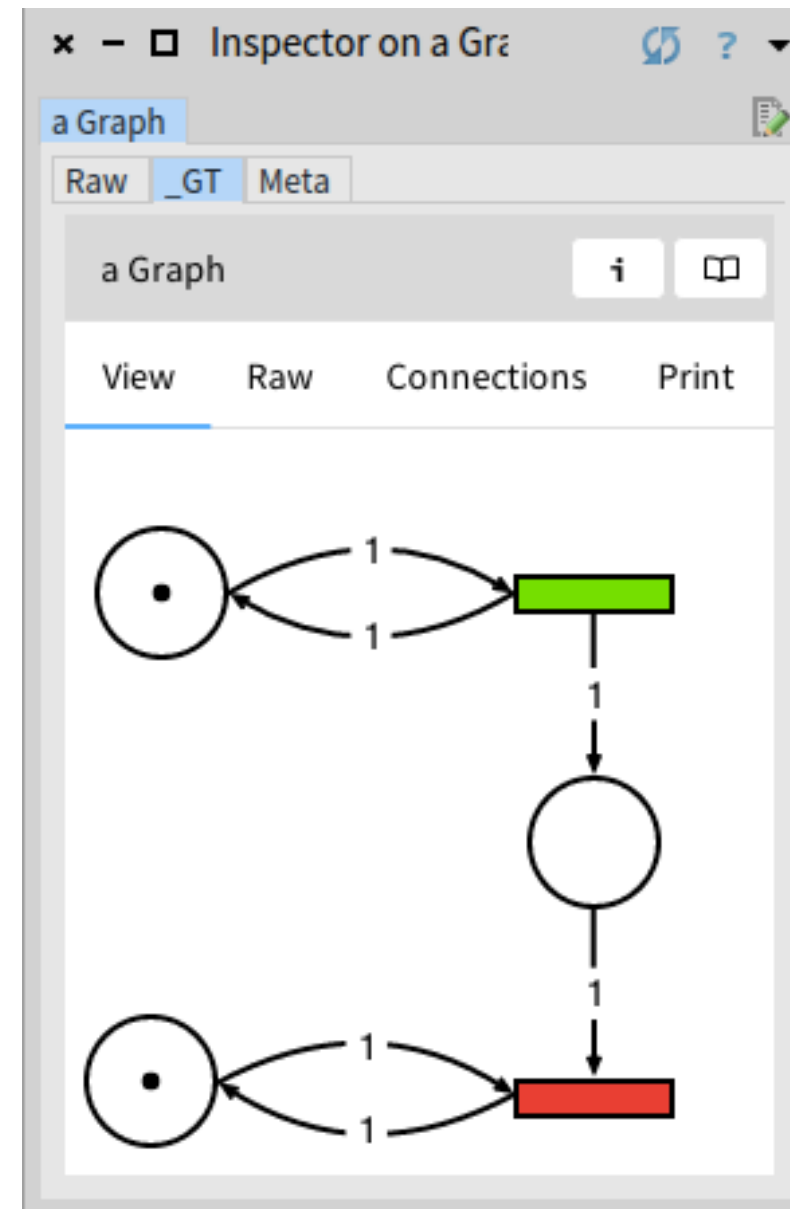

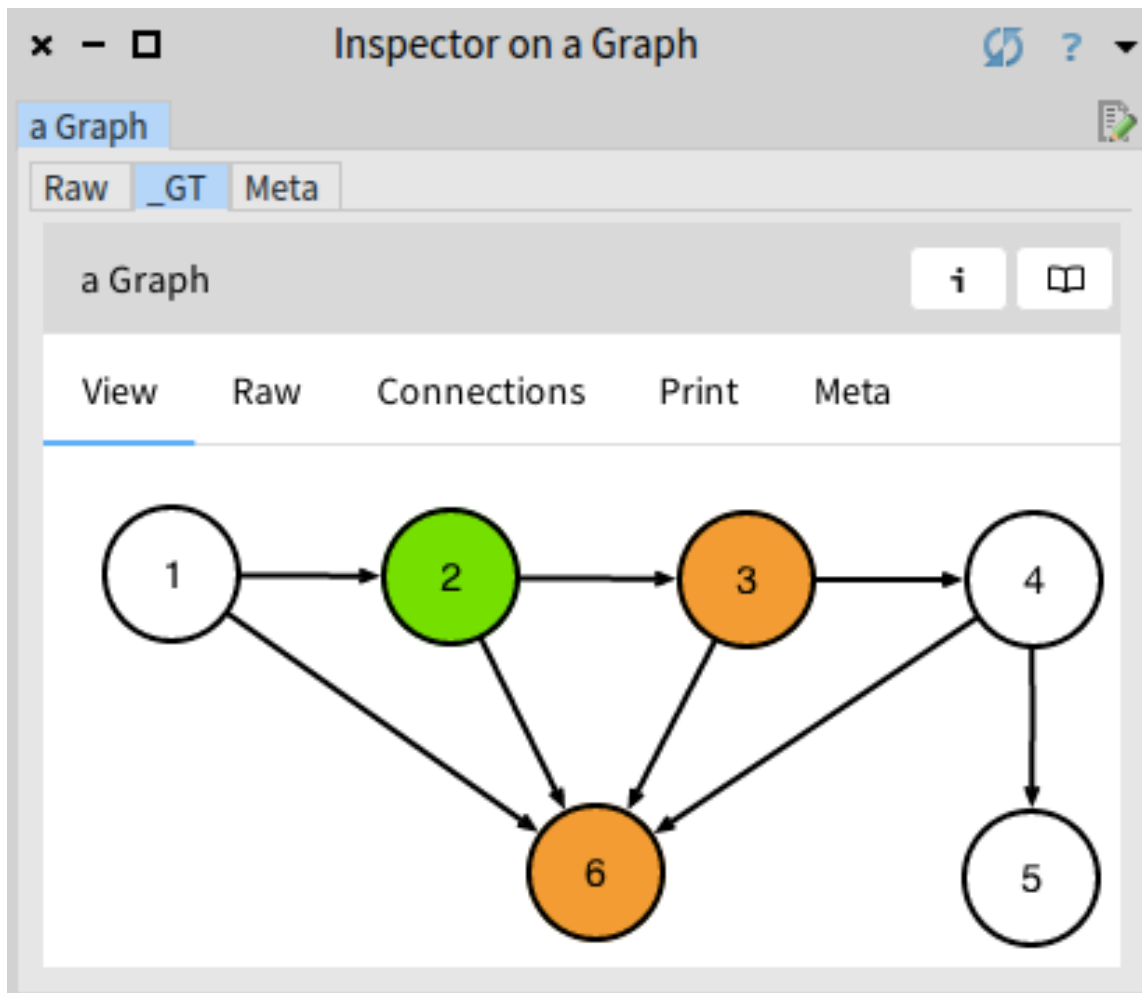

1. Interactive graph editor
2. Export created graph as code

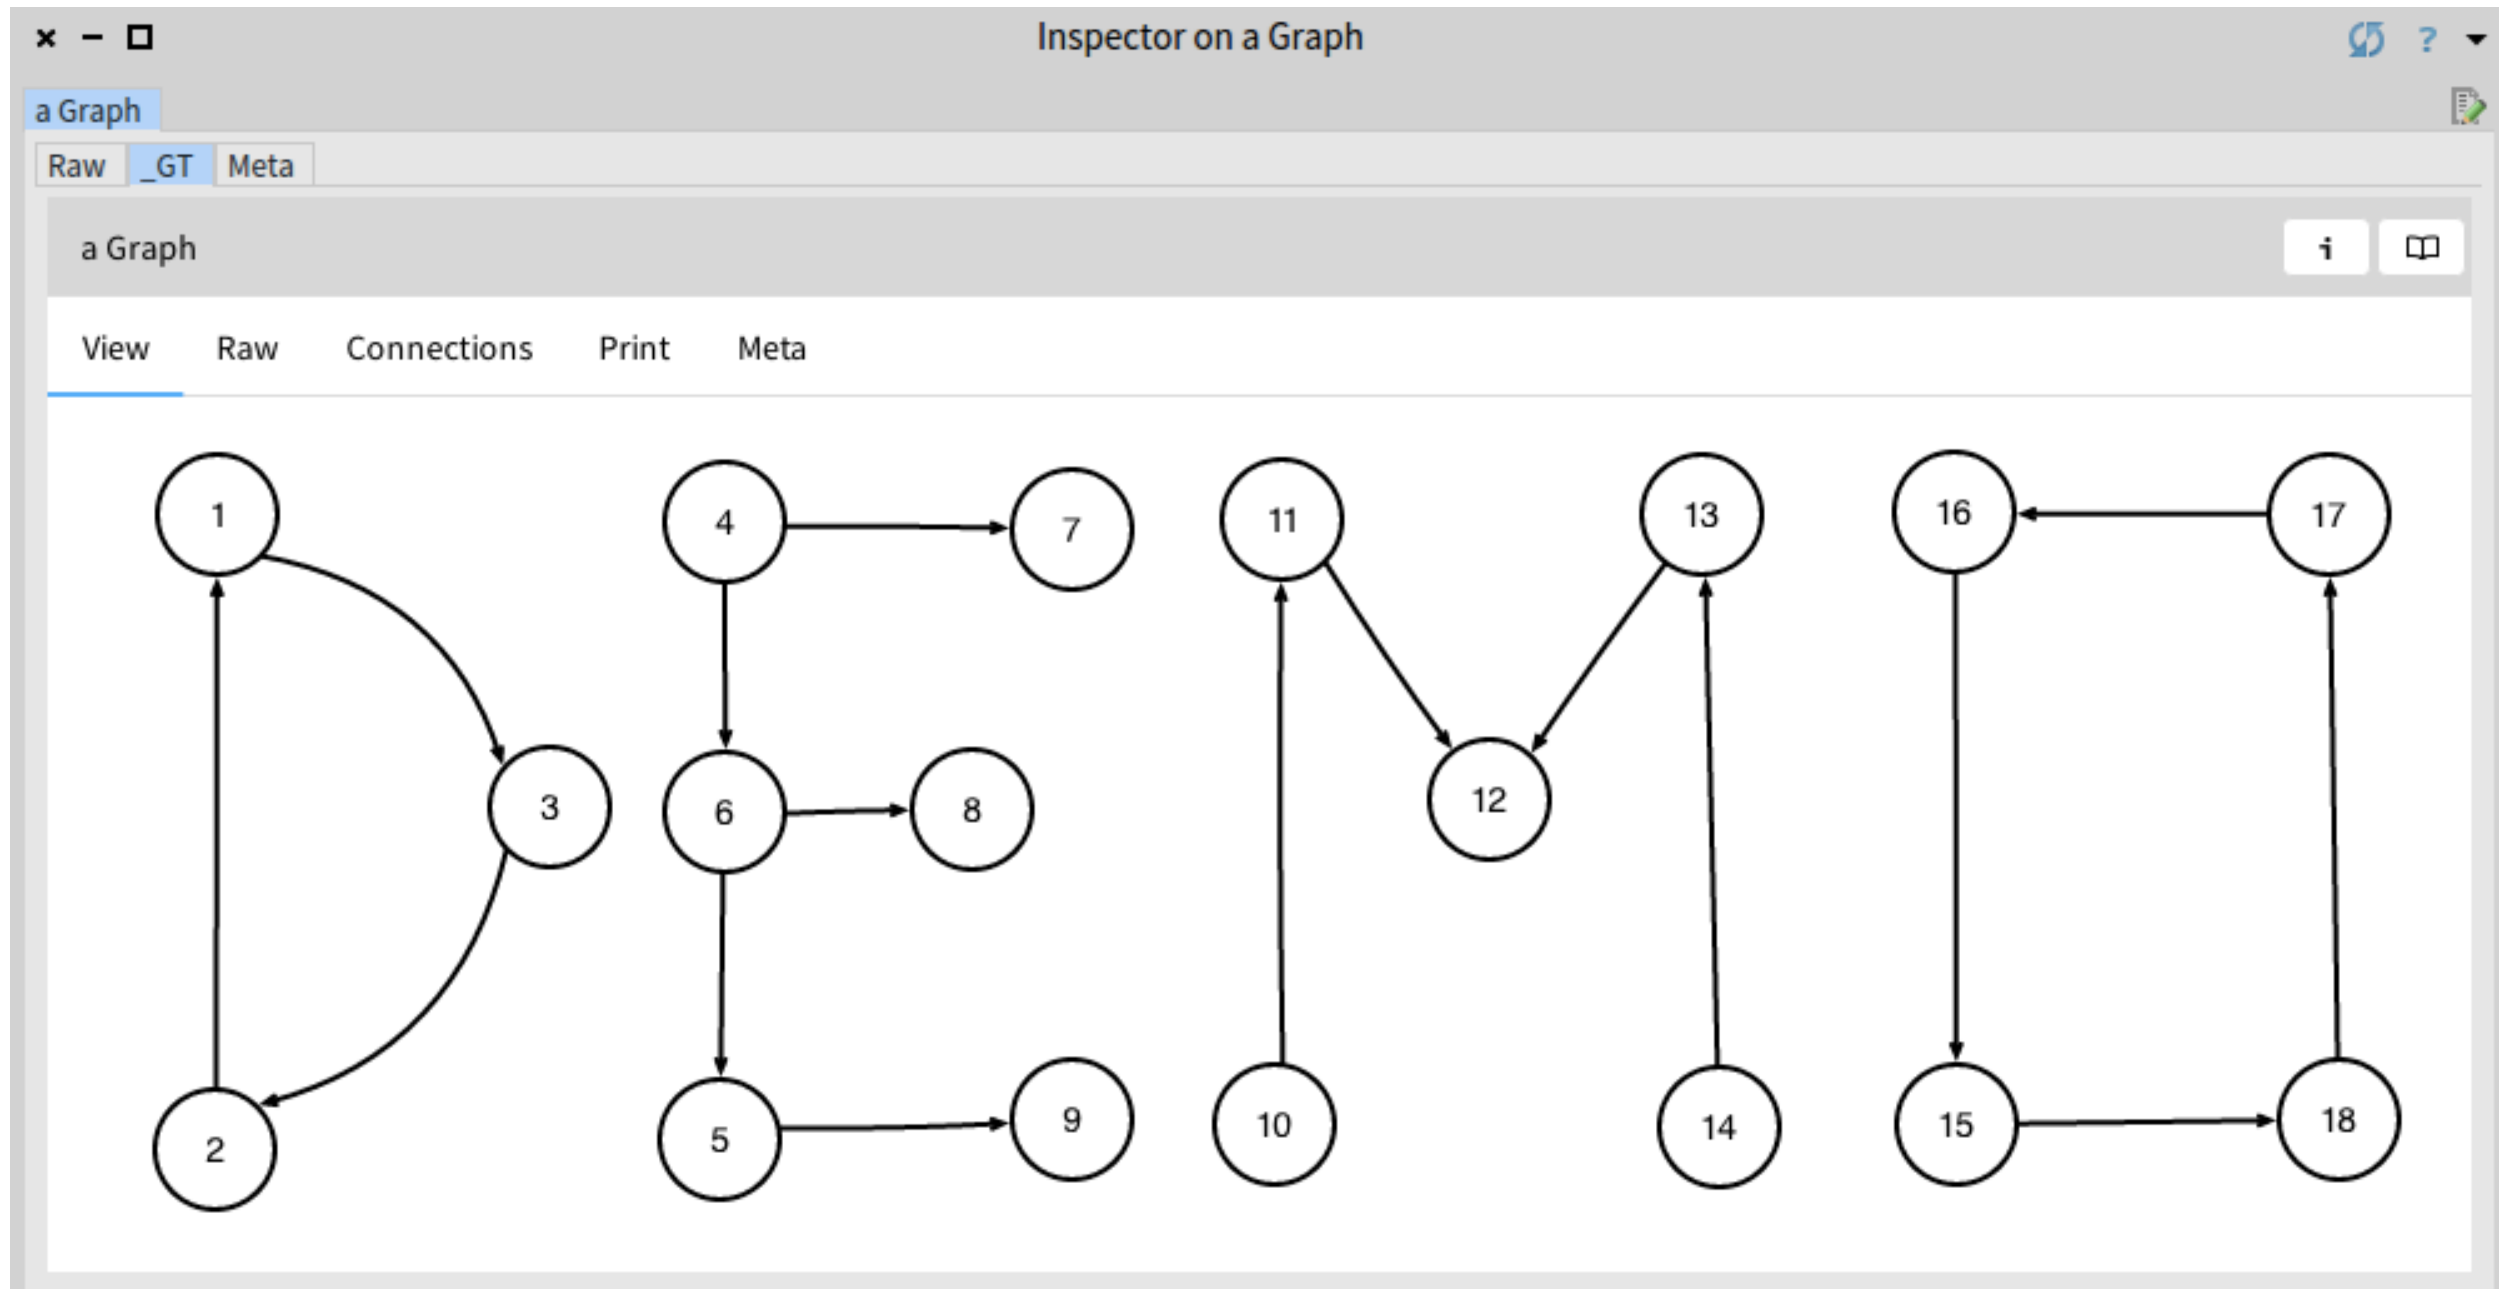

```
demo1
<gtExample>
self nodes: #(1 2 3 4) asOrderedCollection.
self places: #() asOrderedCollection.
self transitions: #() asOrderedCollection.
self edges: {1->2. 2->3. 3->2. 3->4} asOrderedCollection.
self currentState: 1.
self weights: {(1->2)->0.(2->3)->0.(3->2)->0.
(3->4)->0} asOrderedDictionary.
self tokens: {} asOrderedDictionary.
self nodeLocations: { 1->(143.0@123.0). 2->(30.0@128.0).
3->(27.0@9.0). 4->(141.0@11.0)} asOrderedDictionary.
```

# Implementation results

- 3. Implementation of finite state automata (FSA)
- 4. Implementation of petri net

# Challenges

- Finding a stable GT version
- Limited sources of knowledge about Bloc

# Possible future work

- Implement further graph models, i.e. extend syntax & semantics.
- Add algorithms for solving graph problems (e.g. max flow problem).
- Integration into the interactive actor modeling project.

# Summary

## Project goals

Experiment with ways to quickly build graph models using Bloc:

- interactively construct graphs
- assign interpretation to graphs (semantics)
- execute graph models

3

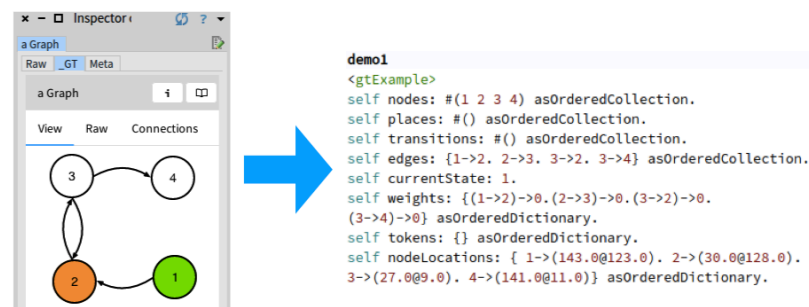

## Possible future work

- Implement further graph models, i.e. extend syntax & semantics.
- Add algorithms for solving graph problems (e.g. max flow problem).
- Integration into the interactive requirements modeling project.

11

## Implementation results

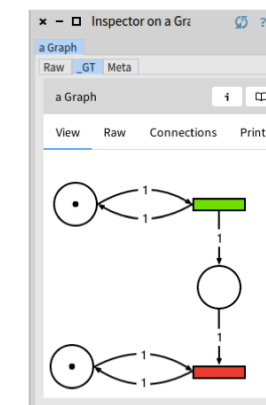

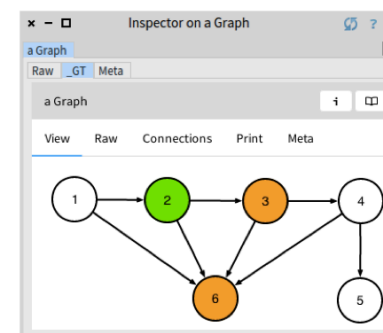

1. Interactive graph editor (syntax)
2. Export created graph as code

7

## Implementation results

3. Implementation of finite state automata (FSA)
4. Implementation of petri net
